 Homework 10
 Due: Wednesday, November 29

1. Find the set of P -positions for the take-away games with subtraction sets
 - (a) $S = \{1, 3, 7\}$.
 - (b) $S = \{1, 4, 6\}$.

Suppose now that there are two piles and the rules for each pile are as above. Now find the P positions for the two pile game where in one pile S is as in (a) and the other pile is as in (b).

Solution:

- (a) The first few numbers are

j	0	1	2	3	4	5	6	7	8	9	10
$g_1(j)$	0	1	0	1	0	1	0	1	0	1	0

It is apparent that $g_1(j) = j \pmod 2$ and this follows by an easy induction: If j is even then $j - x, x \in S$ is odd and if j is odd then $j - x, x \in S$ is even.

- (b) The first few numbers are

j	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
$g_2(j)$	0	1	0	1	2	0	1	0	1	2	0	1	0	1	2

So, we see that the pattern 0 1 0 1 2 repeats itself. Again, induction can be used to verify that this continues indefinitely.

- (c) The P -positions are those j, k for which $g_1(j) \oplus g_2(k) = 0$.
 Thus $P = \{j : (j \pmod 5 = 4) \text{ or } (j \pmod 10 \geq 5)\}$.

2. Consider the following game: There is a pile of n chips. A move consists of removing any *proper* factor of n chips from the pile. (For the purposes of this question, a proper factor of n , is any factor, including 1, that is strictly less than n .) The player to leave a pile with one chip wins. Determine the N and P positions and a winning strategy from an N position.

Solution: n is a P -position iff it is odd. If n is even then the next player can simply remove one chip. If n is odd, then any factor of n is also odd.

3. In a take-away game, the set S of the possible numbers of chips to remove is finite. Show that the Sprague-Grundy numbers satisfy $g(n) \leq |S|$ where n is the number of chips remaining.

Solution: Observe that for any finite set A , $mex(A) \leq |A|$ since $mex(A) > |A|$ implies that $A \subseteq \{0, 1, 2, \dots, |A|\}$ which is obviously impossible. In the take-away game $g(n)$ is the mex of a set of size at most $|S|$ and the result follows.
